

## **Slushie Machine**

Electrical needs 20 amp outlet and must be plugged directly into wall. No extension cords!

### Mixing of Flavors

Slushie mix is a ratio of 4:1 four gallons of water to one gallon of slushie mix. It is very important to make your measurements correct.

\*\*\*Helpful hints\*\*\* Purchase 4 gallons of bottled water for each flavor ahead of time. After you mix the flavors you can store them in the refrigerator to keep them cold. This will decrease time for freezing and more time for partying. Mix water and slush base with a whisk stirring vigorously in a bucket. Pour the flavors from the bucket back into the gallon jugs. The machine holds about 2.5 to 3 gallons of slushie mix per side.

### Using the Machine

Pour slushie flavors in the clear basins. Turn on the main power (looks like a lightning bolt). Turn on the augers and the freezer (looks like a circular arrow and a snow flake). In a few minutes, the green light will turn on. This means that the compressor has turned on. In about 3/4 of an hour, look for ice flakes in the slushie mix. Please allow 1-2 hours to let the slushie freeze totally. The time for freezing is dependent on where you place the machine. If you are in a cool, dry area it will take less time to freeze. If you are in a hot, humid area it will take a little longer to freeze. Try to keep the machine out of direct sunlight.

### Cleaning of the Machine

Drain unused portion of the slushie mix and rinse the inside holding area. Do not allow any water to be squirted into the base of the machine. You DO NOT have to take the machine apart, we will do that for you!!
